## Overview

The SolidRun SR-uSOM-MX6 is a high performance micro system on module that is based on the highly integrated Freescale i.MX6 family of products.

### The SR-uSOM-MX6 Highlighted Features

- Ultra small MicroSOM (47x30mm) with 3 board to board connectors. Mating height is carrier board dependent.
- Freescale i.MX6 SoC (supports solo, dual lite, dual and quad versions)
  - Up to quad Cortex A9 and up to 1.2GHz
  - Integrated multi format decoders and encoders, de-interlacing and color conversion functions
  - Integrated OpenVG, OpenGL ES 2.0 and OpenCL 1.1 EP GPU
- DDR3 memories in x32 or x64 configurations (either 2 x16 or 4 x16 on a single chip select)
- Power management devices
- Gigabit Ethernet phy based on Qualcomm Atheros 8035 (footprint compatible with 8030 fast Ethernet phy)
- Broadcom BCM4330 based WiFi 11n and Bluetooth 4.0 (2.4GHz)

### The SR-uSOM-MX6 Supporting Products

The following products are provided from SolidRun both as production level platforms and reference examples on how to incorporate the MicroSOM in different levels of integration:

- CuBox-i – A minicomputer that is only 2"x2"x2" in size that runs Android and Linux with different distribution variants, use cases.
- HummingBoard – A board computer that incorporates the MicroSOM, retains the same Android and different Linux distributions while adding extra hardware functionalities and access to the hardware.

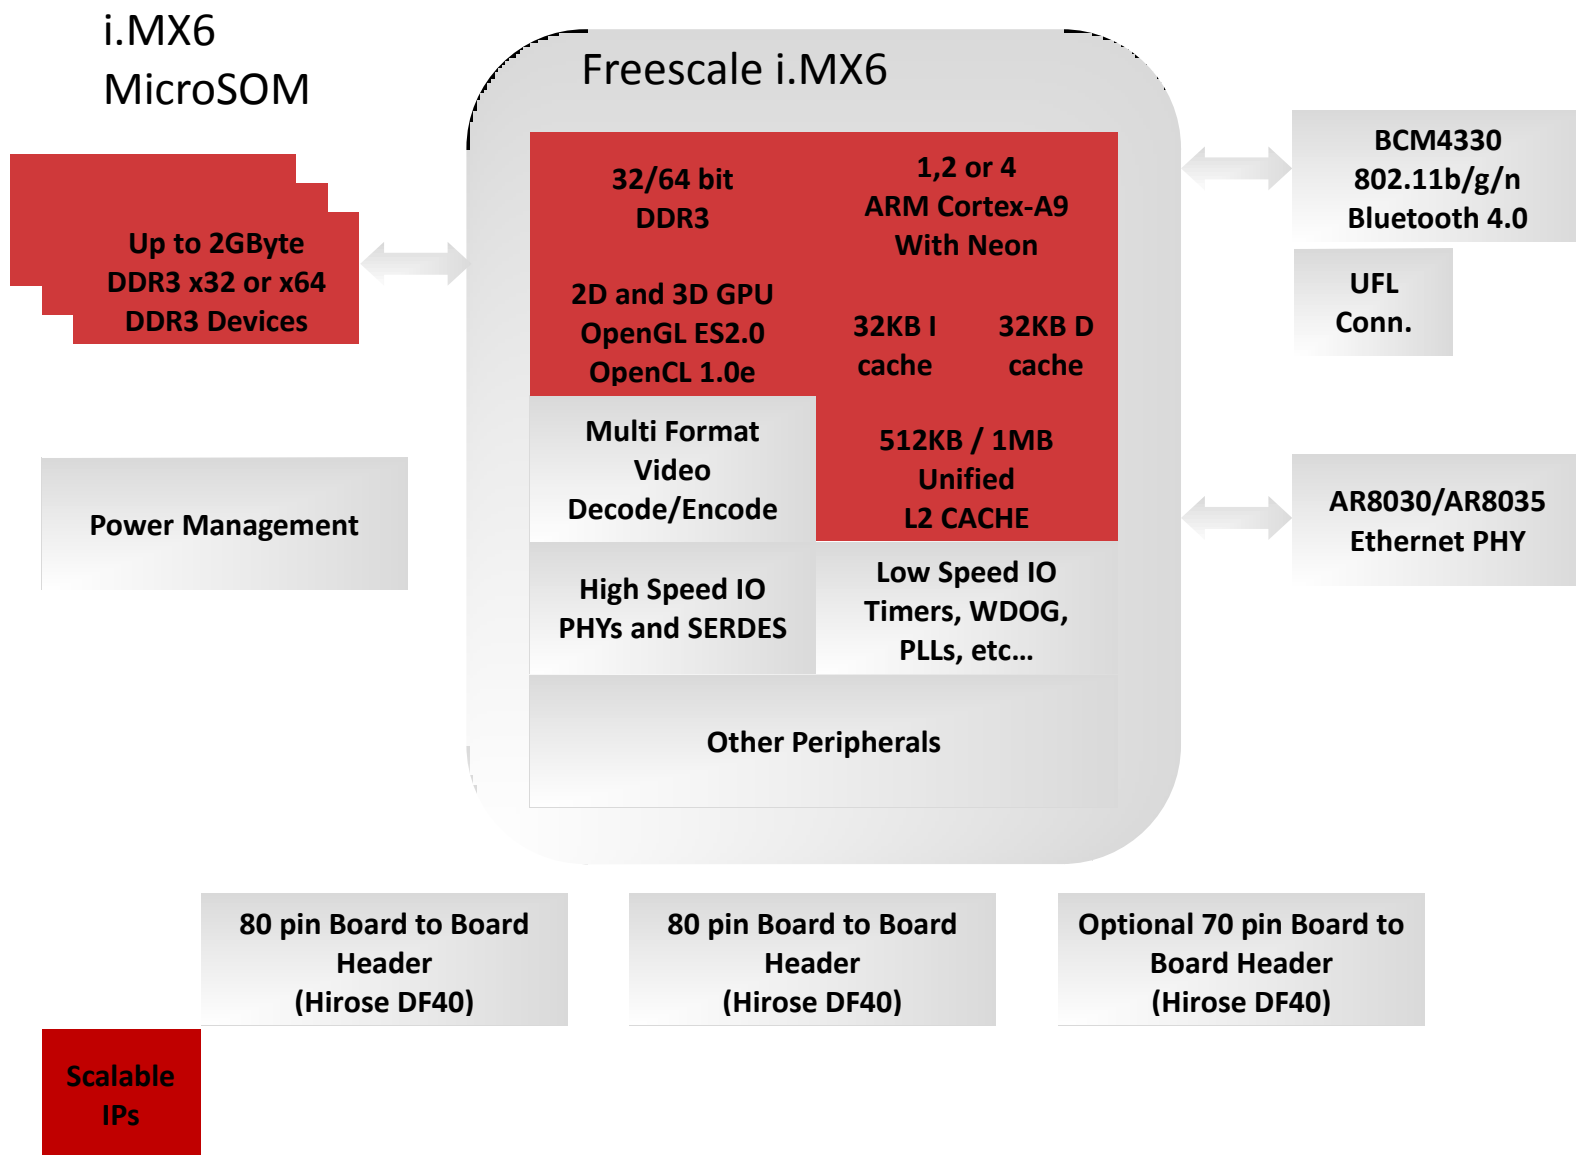

### The SR-uSOM-MX6 Features Summary

Following is the features summary of the MicroSOM. Notice that some of the features are pinout multiplexed (please refer to the pin muxing below and the Freescale i.MX6 data sheets):

- Freescale i.MX6 series SoC (Solo/Dual Lite/Dual/Quad ARM® Cortex™ A9 Processor, up to 1.2 GHz)
- Up to 2GByte (Special 4GByte orders are possible) DDR3 memory
- HDMI 1.4 interface
- LVDS display interface
- MIPI DSI
- MIPI CSI-2
- Parallel camera interface
- Parallel display interface
- 10/100/1000 Mbps Ethernet PHY
- Wireless LAN 802.11 b/g/n and Bluetooth 4.0

- 1 x USB 2.0 host and 1 x USB 2.0 OTG
- 3 x SD / MMC interfaces
- Serial interfaces
- CAN Bus
- Required power supplies –
  - One 3.3V to 5.0V interface (called in the doc VIN\_5V0)
  - One 3.3V (called in the doc NVCC\_EIM0)
  - One SNVS and VDDHIGH\_IN power supply (called in the doc VSNVS\_3V0)  
Notice how NVCC\_EIM0 and VSNVS\_3V0 can be combined into one in the HummingBoard design.
  - Optionally Two SD interface power supplies (NVCC\_SD2, NVCC\_SD3) can be externally set to either 3.3v or 1.8v for UHS-1 support.

### Block Diagram of the SR-uSOM-MX6

## Core System Components

### i.MX6 SoC Family

The Freescale i.MX6 SoC is an implementation of the ARM Cortex™-A9 core, which operates at frequencies up to 1.2 GHz. The i.MX6 provides a variety of interfaces and supports the following main features:

- Single, dual and quad processor ARM Cortex™-A9 SMP configuration. Each processor includes:
  - 32 Kbyte L1 Instruction Cache
  - 32 Kbyte L1 Data Cache
  - Private Timer and Watchdog
  - Cortex-A9 NEON MPE (Media Processing Engine) Co-processor -
    - SIMD Media Processing Architecture
    - NEON register file with 32x64-bit general-purpose registers
    - NEON Integer execute pipeline (ALU, Shift, MAC)
    - NEON dual, single-precision floating point execute pipeline (FADD, FMUL)
    - NEON load/store and permute pipeline
- Unified L2 cache
- General Interrupt Controller (GIC) with 128 interrupt support
- Global Timer
- Snoop Control Unit (SCU)
- Integrated Power Management unit:
  - Die temperature sensor with alarms
  - Dynamic voltage and frequency scaling for low power modes
  - Flexible clock gating control scheme
- Graphics and Multimedia and hardware acceleration engines:
  - Video Processing Unit (VPU) – A DSP with hardware acceleration engines for video decoding and encoding
  - Image Processing Unit (IPUv3) – A hardware engine for processing images, frames, de-interlacing and various other tasks
  - 3D Graphics Processing Engine (3D GPU) – OpenGL ES 2.0 and OpenCL 1.1 EP GPU engine scalable from one shader up to 4
  - 2D Graphics Processing Engine (2D GPU) – For BitBlit function etc...
  - 2D Graphics Processing Engine (OpenVG) – OpenVG compliant GPU
  - Asynchronous sample rate converters (ASRC)
- Security:
  - ARM TrustZone including the TZ architecture (interrupt and memory separation)
  - CAAM module – cipher acceleration and assurance module including a true pseudo random number generator (NIST certified)
  - Secure boot (HAB) and central security unit controlled via OTP fuses
- I/O:
  - High Speed USB 2.0 OTG (Up to 480 Mbps) with integrated HS USB Phy

- High Speed USB 2.0 HOST (Up to 480Mbps) with integrated USB phy
- Single lane PCI-Express 2.0 (includes clock generation)
- Misc. SD and MMC interface with 3.3v / 1.8v voltage level support (for UHS-1 speeds)
- Misc. serial interfaces (SPI, NOR, I2S, I2C, CAN etc...)

Refer to Freescale i.MX6 datasheets with regards to differences between the different devices, number of processors, L2 cache size, GPU supported (i.e. gc880 vs gc2000), etc...

## 10/100/1000 Mbps Ethernet PHY

The Ethernet PHY is based on Qualcomm / Atheros AR8035 phy and incorporates the following features:

- 10BASE-Te/100BASE-TX/1000BASE-T IEEE 802.3 compliant
- 1000BASE-T PCS and auto-negotiation with next page support
- IEEE 802.3az EEE
- Green ETHOS power saving modes with internal automatic DSP power-saving scheme
- SmartEEE
- Wake on LAN
- Automatic MDI/MDIX crossover and polarity correction
- IEEE 802.3u compliant auto negotiation
- Cable Diagnostic Test (CDT)

The phy is connected via the i.MX6 RGMII interface.

## Wireless LAN 802.11 b/g/n and Bluetooth 4.0 SiP

The system in package (SiP) is based on AzureWave AW-NH660 module and incorporates the following features:

- BCM4330 WiFi / BT based
- WiFi / BT co-existence support
- WiFi –
  - Integrated CPU with on-chip memory for complete WLAN subsystem minimizing the need to wake up the application processor
  - SDIO based interface (connected via the i.MX6 SD1 interface)
  - Single band 2.4 GHz 802.11 b/g/n
  - Supports IEEE 802.11d, e, j, l, j, r, k, w
  - WEP, WPA/WPA2, AES, TKIP, CKIP (SW) based security
  - WMM/WMM-PS/WMM-SA
  - Proprietary protocols – CCXv2/CCXv3/CCXv4/CCXv5, WFAEC
- Bluetooth:
  - Fully supports Bluetooth 4.0 + EDR (AFH, QoS, eSCO, fast connect, SSP, SSR, EPR, EIR, LST)
  - High speed UART (max 4Mbps) and PCM for Bluetooth support (connected via i.MX6 UART4 interface and i.MX6 AUD3 audio PCM interface)
  - HS packet types, class 1 or class 2 transmitter type operation

## SR-uSOM-MX6 Interfaces

### SR-uSOM-MX6 External Interfaces

The MicroSOM incorporates 3 Hirose DF40 board to board headers.

The choice of the Hirose DF40 is due to the following:

- Miniature (0.4m pitch)
- Highly reliable manufacturer
- Highly available (worldwide distribution channels)
- Excellent signal integrity (supports 6Gbps). Contact Hirose or SolidRun for reliability and test result data.
- 1.5mm to 4.0mm mating height (1.5mm to 3.0mm if using 70-pin Board-to-Board header). SR-uSOM-MX6 headers are fixed and mating height is determined by carrier implementation

The different board to board functionality is defined as follows:

- Main 80pin B2B. Includes the following functionality:
  - Main supply +3.3v to +5.0v in (5 pins)
  - I/O supply +3.3V and SD2, SD3 supplies (can be fixed +3.3V or externally switched +3.3V / 1.8V to support UHS-1)
  - Ethernet MDI (4 differential pairs), LED activity or link (10/100/1000) and Ethernet TCT
  - SATA TX/RX (2 differential pairs)
  - USB OTG and HOST (2 differential pairs)
  - Various GPIOs and pins that can be muxed. By default it is configured to be 2xI2C, PWM1..4, SPI 2, SD2 interface and USB enable.
- Second 80pin B2B. The board to board exposes the following functionality:
  - System power on reset
  - HDMI 1.4 (4 differential pairs), CEC, +5V boosted I2C and HDMI HPD
  - PCI express 2.0 (3 differential pairs include TX/RX and clock)
  - USB OTG charge detect and USB OTG ID
  - MIPI CSI 2 (3 differential pairs for solo / dual lite and 5 differential pairs for dual / quad versions)
  - MIPI DSI (3 differential pairs)
  - LVDS 0 (5 differential pairs)
  - UART1 (typically used for main system debug port)
  - Various GPIOs and pins that can be muxed. By default it is configured to be AUD5 I2S interface, CCM CLK01/CLK02, SD2 voltage select, SPDIF out, USB HOST / OTG over current indication.
- Third 70pin B2B. This board to board exposes the following functionality:
  - Power management (EIM\_WAIT, TAMPER, PMIC standby, MX6\_ONOFF, PMIC\_ON\_REQ)
  - Boot mode override

- MLB interface (marked as reserved. Contact SolidRun about availability of i.MX6 MicroSOM with MLB interface)
- Various GPIOs and pins that can be muxed. By default it is configured to be UART3, SPDIF in, Display and camera parallel interface, UART2, Watchdog timer, SD3 and SD4 interfaces)

## SR-uSOM-MX6 On Board Functions

### 10/100/1000 Mbps PHY

The MicroSOM incorporates a Qualcomm / Atheros AR8035 PHY. The phy connectivity is as follows:

- Uses 2.5V interface voltage level
- RGMII (optional AR8030 with RMII)
- Phy reset function via i.MX6 pad V5 (KEY\_ROW4). Active low
- Default phy address either 0x0 or 0x4 (depends on LED activity reset strap, either pulled down or pulled up)

\* Note that due to internal i.MX6 buses the 1000Mbps interface speed is limited to 470Mbps.

### 802.11 b/g/n and Bluetooth SiP

The MicroSOM incorporates AzureWave AW-660 system in package (SiP) that is based on BCM4330. The SiP interfaces are:

1. WiFi connectivity via i.MX6 SDIO1
2. Bluetooth connectivity via i.MX6 UART4
3. Audio PCM connectivity via i.MX6 AUD3
4. Antenna via onboard UFL connector

## SR-uSOM-MX6 External Interfaces Detailed Description

As previously described, the MicroSOM incorporates three Hirose DF40 based board to board headers.

The MicroSOM uses the header of those board to board connectors which is fixed in height, while the mating height is determined by the carrier, by using different Hirose DF40 receptacle mating heights (1.5 to 4.0mm) (1.5mm to 3.0mm if using 70-pin Board-to-Board header).

Following is a color legend to be used for the description of the board to board connectors:

### Color Legend

## SR-uSOM-MX6 Integration Manual

### SR-uSOM-MX6 Power Up Sequence

Integration with the SR-uSOM-MX6 is easy, power sequencing wise. Note the following requirements:

- The MicroSOM internal power management contains a soft-start clamp that gradually raises its internally generated power supplies once VIN\_5V0 is applied. The soft-start timing is set to be 800us (typ.). SNVS\_3V0 must be applied well ahead of the internal power rails. We recommend that SNVS\_3V0 be applied no later than 200uS after VIN\_5V0.
- SNVS\_3V0 must be applied before NVCC\_EIM0, NVCC\_SD2 and NVCC\_SD3. Alternatively, SNVS\_3V0 can be shorted with those power supplies as long as they do not exceed 3.3v (absolute maximum including overvoltage ripples). Notice the HummingBoard design, where there is a single 3.2V power rail generated from the 5V DC IN (either via LDO or external DC-DC), and that rail is directly applied to VSNVS\_3V0, NVCC\_EIM0 together with the VIN\_5V0.

## SR-uSOM-MX6 Debugging Capability

The SR-uSOM-MX6 exposes two main debugging interfaces:

1. UART RS-232 interface
2. JTAG interface

The UART RS-232 interface is a null modem interface that is internally pulled up to two different voltage levels:

1. NVCC\_EIM0 voltage in case AzureWave SiP is not used (typically 3.3V)
2. 2.8v when the AzureWave SiP is used (signals are shared with SDIO interface that is limited to 2.8V)

The UART interface is optional to use and mentioned here since most of the software infrastructure used in CuBox-i and HummingBoard uses those two signals for debugging.

JTAG interface is on the SR-uSOM-mx6 and is exposed as test pins. Following is a snapshot of the test points and its connectivity traces:

## Differences between SR-uSOM-MX6 Versions

Changes between SR-uSOM-MX6 rev 1.1 to rev 1.2:

Moved VDD\_HIGH\_IN power rail from NVCC\_EIM0 power pin to SNVS\_3V0 power pin.

Changes between SR-uSOM-MX6 rev 1.2 to rev 1.3:

Added three mechanical holes for RF cage to cover BCM4330 based WiFi/BT SiP.

## SR-uSOM-MX6 Typical Power Consumption

The following power measurements were performed on a CuBox-i4pro based system, where the main supply is 5V and internally a 5V to 3.3V LDO is being used on the carrier board (refer to CuBox-i rev-1.1 schematics).

The CuBox-i4pro incorporates the quad processor at 1GHz, 2GByte of DDR3 memory, gigabit Ethernet phy and the WiFi and Bluetooth chipset.

Setup	5V DC input power consumption	Notes
Android idle	240mA	Performance governor, HDMI is on, USB, eSata, WiFi and Ethernet are off
Android idle with Ethernet	340mA	Performance governor, HDMI is on, USB, eSata, WiFi and Ethernet is 1Gbps (note #1)
Android Nenamark2 benchmark	750mA	Performance governor, HDMI is on, usb, sata, wifi and Ethernet are off
Full load - Android Nenamark2 benchmark + 4 processors running 100% (dd command memory to memory)	1190mA	Performance governor, HDMI is on, USB, eSata, WiFi and Ethernet is 1Gbps (note #1). Tj is 55c
Full load - Android Nenamark2 benchmark + 4 processors running 100% (dd command memory to memory)	1300mA	Performance governor, HDMI is on, usb, sata, wifi and Ethernet is 1Gbps (note #1). Tj is 87c (note #2)
Video 1080p Big Buck Bunny with AC3 audio codec (gstreamer from local SD)	Varies between 340mA to 410mA	Performance governor, HDMI is on, USB, eSata, WiFi and Ethernet are off
Linux idle	170mA	Performance governor, HDMI, USB, eSata, WiFi and Ethernet are all off.
Linux suspend to memory	30mA	Note #3

### Notes:

1. CuBox-i uses an LDO that provides 5V to 3.3V conversion that feeds the Ethernet PHY on the MicroSOM. Due to that, the addition of 100mA on the 3.3V rail when PHY is set to 1Gbps, adds 100mA consumption on the 5.0V power rails.
2. Notice the power difference between the same workload while Tjunction of the die is 55c and 87c (~110mA difference from the 5V power rail). It takes about 60 minutes to reach that stable 87c Tjunction.
3. This is using Linux suspend to memory when the front LED is off. This consumption is mainly due to DDR entering self-refresh (2GByte) and some consumption on the 3.3V LDO and leakage on the processor and SoC digital part rails.

## SR-uSOM-MX6 Maximum Rating

Following are the maximum ratings on different power signals and power rails.

Parameter Description	Symbol	Min	Max	Unit
Supplies VDD_SNVS_IN and VDD_HIGH_IN on i.MX6 starting rev 1.2	VSNVS_3V0	2.8	3.3	V
eMMC/SD supply voltage	NVCC_SD2 NVCC_SD3	1.65	3.6	V
Main 3.3v supply voltage for i.MX6, Ethernet phy and other	NVCC_EIM0	3.2	3.6	V
USB OTG and H1 supply voltage	USB_OTG_VBUS USB_H1_VBUS	4.4	5.25	V
DC-DC supplies, HDMI I2C boost and WiFi/BT main supply (1)	VIN_5V0	3.3	6	V
Supplies VDD_SNVS_IN and VDD_HIGH_IN on i.MX6	VSNVS_3V0	-	250	mA
Supplies i.MX6 (GPIO, Parallel display interface etc...), AR8030/AR8035 Ethernet phy, part of the AzureWave SiP	NVCC_EIM0	-	300 (2)	mA
SD2 I/O	NVCC_SD2	-	22 (3)	mA
SD3 I/O	NVCC_SD3	-	40 (3)	mA
Supplies all SR-uSOM-MX6 power management devices.	VIN_5V0	-	1500 (4)	mA

- (1) HDMI I2C is voltage boosted using VIN\_5V0 power rail. Due to that VIN\_5V0 = 5V is recommended since HDMI EDID requires 5V voltage levels.
- (2) AR8035 Gigabit Ethernet PHY consumes 150mA out of those in a 100meter cable configuration.  
This is reduced to 150mA when the AR8035 is not active.
- (3) Assumes ultra-high speed: 1.8v, 100MHz clock rate and double data rate on data; 4 bit data on SD2 and 8 bit data on SD3.
- (4) Assumes VIN\_5V0 = 5v. When supplying less than 5V, the maximum current increases accordingly; it is recommended to add additional margins on current limit.

## SR-uSOM-MX6 Mechanical Description

Following is a diagram of the **TOP VIEW** of the SR-uSOM-MX6.

Notice the following details:

- The carrier board must use the same footprint as in the above mechanical footprint.
- J5002 is the main board to board header (bottom side in the diagram).
- J8004 is the second board to board header (upper side in the diagram).
- J5001 is the third board to board header (right side in the diagram).
- CuBox-i design does not use the mechanical holes, since the mating strength of two Hirose DF40 pairs and the internal heat spreader is satisfactory for the design requirements.
- In case 1.5mm mating height was chosen, then the SR-uSOM-MX6 requirement would be that all area beneath it on the carrier will be all dedicated **ONLY** for the board to board connectivity; no other components are allowed.  
In case higher mating is chosen, then 1.5mm should be reserved for the SR-uSOM-MX6. For instance, if 3.5mm mating height is chosen, then 1.5mm is dedicated to the MicroSOM print side components and the remaining 2mm for the carrier components underneath the MicroSOM.
- Refer to SolidRun HummingBoard and CuBox-i design and layout, where there are examples of the main and second 80 pin header board to board usage.
